

### **Passive piezo transducer pickup installation instructions.**

#### **Please note;**

Although every system is tested before shipping, we recommend that you plug it into your amp and test it before installation. This can be done by simply tapping on the transducers while plugged in. You should hear the tapping sounds through your amplifier.

#### **Tools you will need;**

**A drill**

**A 3/8 drill bit**

**A small amount of super glue**

**Please note; The piezo's must be handled with care during installation.**

#### **Installation;**

1. Mark the desired location for the jack using a pencil.
2. Remove the strings to provide easier access inside the soundhole.
3. Carefully drill the hole using the 3/8 paddle bit.
4. Remove the nut and washer from the jack.
5. Install the jack by pushing it through the hole from the inside.
6. You may want to experiment with the placement of the piezo before fixing it into place. You can do this using a piece of masking tape to temporarily hold it in place. You will get a different tone in different places on the guitar top. The ideal location that will result in the most amount of gain is directly below the saddle on the bridgeplate.
7. Place a drop of super-glue on the piezo and firmly hold it place for about 45 seconds.

**That's it! Replace strings, tune up, and plug it in!**

**We cannot accept any responsibility for guitar damage caused by installation.**
